Procedure Orders

1. Debridement [670962504] ordered by Charles Arnold Jr., MD

Subjective

9/3/25 - CJA-patient returns to the wound care center today for management of her multiple wounds. Everything still looks a lot better. Patient really only has 1 wound left of her heel. It is pretty necrotic and debridement was medically necessary at the site. Wound without any surrounding erythema induration odor nor periwound maceration. Will apply Santyl here in the clinic and Medihoney at home for patient.

8/18/25 - CJA-patient returns to the wound care center today for management of her multiple wounds. Everything looks a lot better today. The neck looks improved and is pretty much resolved as is everything of the buttocks and lower back. Patient's any surrounding erythema induration odor nor periwound maceration. Patient's caretaker has purchased some Roho offloading heel cushions. The sound fantastic and they plan on using them in the very near future.

8/4/25 - CJA-pleasantly demented (end stage) 89-year-old female who comes in today for management of multiple wounds. Patient was discharged from bluegrass hospice is 2024 after survival time was longer than anticipated. Daughter is primary caretaker and patient lives with her. Daughter is most concerned in regards to wound of her right heel. Patient has developed contractures and has been pressing her heel against her bed. Daughter has come up with a series of neck pillows to float the heel. Advised her to continue doing this. Patient no longer can ambulate. Patient's p.o. intake has tremendously decreased but she still takes soda and tea and milkshakes with protein mixed in with the milkshake. She has been losing weight according to daughter. Patient also has an area of her left neck that she has been scratching at. It is partial-thickness and is along the crease of her neck. Advised a combination of antifungal and barrier cream to this area. Daughter was also counseled regarding to using mittens on patient. Patient has excoriated areas of her buttocks that arguably have a pressure quality to them also. We will address these today too. Wounds have been present for a few weeks and worsening. Some drainage associated.

Review of Systems
Constitutional: Negative for fever.
Respiratory: Negative for shortness of breath.
Skin: Positive for wound.

Objective

Last Recorded Vitals
Pulse 73, temperature 97.5° F (36.4° C), temperature source Temporal Artery, resp. rate 18, not currently breastfeeding.
Physical Exam
Constitutional:
Appearance: Normal appearance.
Musculoskeletal:
Right lower leg: No edema.
Left lower leg: No edema.
Skin:
Findings: No erythema.

Comments: Today wound violates both epidermis and dermis layers of skin, wound has exposed subcutaneous

layer and fat layer is exposed. There are areas of necrotic tissue, localized gangrene tissue and biofilm present. Surgical removal of nonviable gangrenous tissue and biofilm infection material is medically necessary and needed to promote healing

Neurological:
General: No focal deficit present.
Mental Status: She is alert. She is disoriented.
Psychiatric:
Mood and Affect: Mood normal.
Behavior: Behavior is withdrawn.
Cognition and Memory: Memory is impaired.
Judgment: Judgment normal.

Labs:
No results found for this visit on 09/03/25 (from the past 24 hours).
No image results found.

Diagnoses and all orders for this visit:

Pressure ulcer of right heel, stage 3 (HCC)

- Wound Treatment

- Debridement

Severe Alzheimer's dementia with other behavioral disturbance, unspecified timing of dementia onset (HCC)

Other specified local infections of the skin and subcutaneous tissue

- Debridement

Localized tissue death (HCC)

- Debridement

Incomplete paraplegia (HCC)

DOS: 9/3/2025

Patient ID: Adriana Feola is a 89 y.o. female.

Debridement

Wound 08/04/25 Plantar: Right

Performed by: Charles Arnold Jr., MD
Authorized by: Charles Arnold Jr., MD

Consent

Consent obtained? written

Consent given by: patient

Risks discussed? procedural risks discussed

Immediately prior to the procedure a time out was called and the performing provider verified the correct patient, procedure, equipment, support staff, and site/side marked as required.

Debridement Details

Performed by: physician

Debridement type: surgical

Level of debridement: subcutaneous tissue

Pain control: lidocaine 2%

Pain control administration type: topical

Pre-debridement measurements

Length (cm): 4.4

Width (cm): 2.3

Depth (cm): 0.1

Surface Area (cm²): 10.12

Post-debridement measurements

Length (cm): 4.5

Width (cm): 2.4

Depth (cm): 0.4

Percent debrided: 100%

Surface Area (cm²): 10.8
Area Debrided (cm²): 10.8
Volume (cm³): 4.32

Tissue and other material debrided: adipose, dermis, epidermis and subcutaneous tissue
Debrided tissue debrided: biofilm, fibrin and slough
Instrument(s) utilized: curette
Bleeding: small
Hemostasis obtained with: pressure
Procedural pain (0-10): 4
Post-procedural pain: 1
Response to treatment: procedure was tolerated well
